AB - SE9400746 The treatment process for a textile fabric to give a pre-determined stiffness and formability comprises the following steps: (1) foularding the fabric with an aq. dispersion of acrylate polymer having a glass transition temp. greater than 10deg.C.; (2) heating the fabric to cross-link and then dry the polymer to a non-tacky state, and opt. repeating steps (1)-(2); (3) ensuring the amt. of deposited polymer is sufficient to give the desired stiffness and formability; (4) calendering the fabric at high pressure; and (5) forming or pleating the fabric to give the desired shape. The polymer is pref. an ethyl acrylate/methyl methacrylate copolymer with a Tg of ca. 25-50deg.C. The fabric is pref. cotton.

- Also claimed are pleated or formed lampshades prepd. by this method.

- ADVANTAGE - A suitable lampshade fabric with good stiffness and rigidity for permanent and non-tacky pleats, and which does not yellow, is prepd. without using environmentally harmful materials such as PVC. (Reissue of the entry advised in week 9546 based on complete specification).
